

A scatter plot showing the relationship between Ozone (x-axis) and another variable (y-axis). The x-axis is labeled 'Ozone' and ranges from 0 to 150. The y-axis is unlabeled but has a grid. The data points are black dots. There is a high density of points at low Ozone values (below 50), with a few points extending to higher Ozone values up to approximately 170. The distribution of points suggests a non-linear relationship, with a peak in the y-variable around an Ozone value of 30-40.
